

## Request for Atlas UX changes for new Cohort Exit Criteria

On the page of creating a new cohort definition, we request to include a new 'Cohort exit criteria' that will allow the cohort end date to be an event end date instead of the default observation period end date.

**Cohort exit criteria:** For all persons who entered the cohort, there must be a specification of when each person be also considered.

---

Add a cohort exit criteria:

- [Based on a fixed time period relative to initial event start or end date](#)
- [Based on the end of an era of persistent exposure to any drug within a defined concept set](#)

We would like to request addition of a new option to the two above to say:

- [Based on the end date of the primary event](#)

Once selected, this will show a drop down option similar to the fixed time period selection.

### Cohort Exit Criteria

Cohort exit criteria based on primary event

- Initial event date to offset from:

[Remove Cohort Exit Criteria](#)

The drop down will include two options:

- Max Event End Date
  - This will select the maximum of records with the same cohort start date for person, instead of default observation period end date
- Event End Date
  - This option will allow replace an event end date as the cohort end date instead of the default observation period end date (e.g, a visit end date).

'Max Event End Date' will be the default choice.
